In opposition to Bill 20-501,  
the “Conversion Therapy for Minors Prohibition Amendment Act of 2013”

Council of the District of Columbia  
Committee on Health  
June 27, 2014

By Peter Sprigg  
Senior Fellow for Policy Studies  
Family Research Council  
Washington, D.C.

Good afternoon. I urge you to oppose Bill 20-501.

At the heart of the attacks on sexual reorientation therapy are two claims – that such therapies are ineffective, and that they are harmful.

However, there is abundant anecdotal evidence that such therapies work – that is, people who say that they were helped by such therapies to change from predominantly homosexual to predominantly heterosexual. There is also scientific evidence. The National Association for Research and Therapy of Homosexuality has [cited](#) “600 reports of clinicians, researchers, and former clients – primarily from professional and peer-reviewed scientific journals” which show that “reorientation treatment has been helpful to many.”

The American Psychological Association (APA), under the sway of a small but influential pro-homosexual lobby, has criticized and discouraged (but never banned) reorientation therapy. Yet even the [APA acknowledges](#) that “participants reporting beneficial effects in some studies perceived changes to their sexuality, such as in their sexual orientation, gender identity, sexual behavior, [and/or] sexual orientation identity.”

Critics cite another APA statement that there is “no sufficiently scientifically sound evidence that sexual orientation can be changed.” This, however, means only that the evidence does not meet all the criteria for “gold standard” social science research, such as large, random samples, a prospective and longitudinal design (tracking people before, during, and after therapy), and use of a control group.

Yet the evidence that sexual orientation change efforts, or SOCE, are harmful is virtually all anecdotal – the kind of evidence which critics of SOCE *refuse* to accept with regard to the effectiveness question.

Since the focus of this bill, and similar bills enacted in California and New Jersey, has been on minors, some may wonder—is there really such a thing as an ex-gay teenager?

There is a dramatic answer in the scholarly literature. Here is a key quote from Ritch Savin-Williams, who is the nation's leading expert on gay teenagers:

In the data set of the longitudinal Add Health study, of the Wave I boys who indicated that they had exclusive same-sex romantic attraction, only 11% reported exclusive same-sex attraction 1 year later; 48% reported only opposite-sex attraction, 35% reported no attraction to either sex, and 6% reported attraction to both sexes (Udry & Chantala, 2005).<sup>1</sup>

From the source cited by Savin-Williams, I learned that “the Wave I boys who indicated that they had exclusive same-sex romantic attraction” consisted of “69 boys [who] indicated that yes, they had ever had a romantic attraction to the same sex, and no, they had never had an attraction to the opposite sex.”<sup>2</sup>

This directly contradicts the politically correct “born gay, can't change” paradigm, which asserts that someone who is *exclusively* homosexual will *always* remain that way, and will remain so *forever*.

But what does the empirical evidence show? Not only did those who were exclusively homosexual *not* all remain so, but *only 11% did*. Some measure of change in sexual orientation—which many homosexual activists say is *impossible*, and *never* happens to *anyone*—is not only possible, but it is the *norm* for adolescents with same-sex attractions, having been experienced by *89% of the respondents* only one year later.

While some pro-homosexual activists will concede that some measure of fluidity exists, they say that *complete* transformation—from *exclusively* homosexual to *exclusively* heterosexual—is not possible. Yet this kind of complete reversal of sexual orientation is exactly what was reported by *almost half* (48%) of the adolescent boys in this survey—and again, after only one year.

The last refuge of the homosexual activists in the face of this kind of evidence is to concede, “Well, yes, a person's sexual orientation *can* change—but only *by accident*, not by *trying* to change it!”

This is somewhat like saying, “Well, yes, obese people *can* lose weight—but not by *trying* to, and certainly not with anyone else's help!”

The California law and New Jersey bill are based on a theory (which also has poor empirical support) that reorientation therapy may harm the self-esteem of those who don't change—the 11%, in this study.

But it makes no sense to address that theoretical harm by hiding the truth from, and denying help to, the 83% of teens who may lose, or overcome, their same-sex attractions.
